Title of Problem: GUI Developer

Indian Institute of Science (IISc), Bengaluru (Winter Internship Program 2023)

PYQT GUI:

Task Management Application

Detail of Project:

The Task Management GUI is created by PYQT module of python, where it is one kind of comprehensive solution for users to efficiently organize and monitor their tasks and regular activities each phase voice guideline will be given so very effective understanding will help in depth. The application has three main components:

Login Window, the Register Window, and the Dashboard.

The Login Window provides a secure entry point for users to access. Users are required to input their credentials, namely a username and password. Password is saving as encrypted formats using bcrypt module. In case of any discrepancies, appropriate warnings are displayed in screen.

If user successfully login, then users can see the Dashboard. It has a user-friendly interface that facilitates easy navigation by voice commands. I used PYMEDIA to navigate at each and every point, The key features include a checklist, a calendar, and detailed user information. Users have the option to create, modify, and delete tasks, each associated with a specific user.

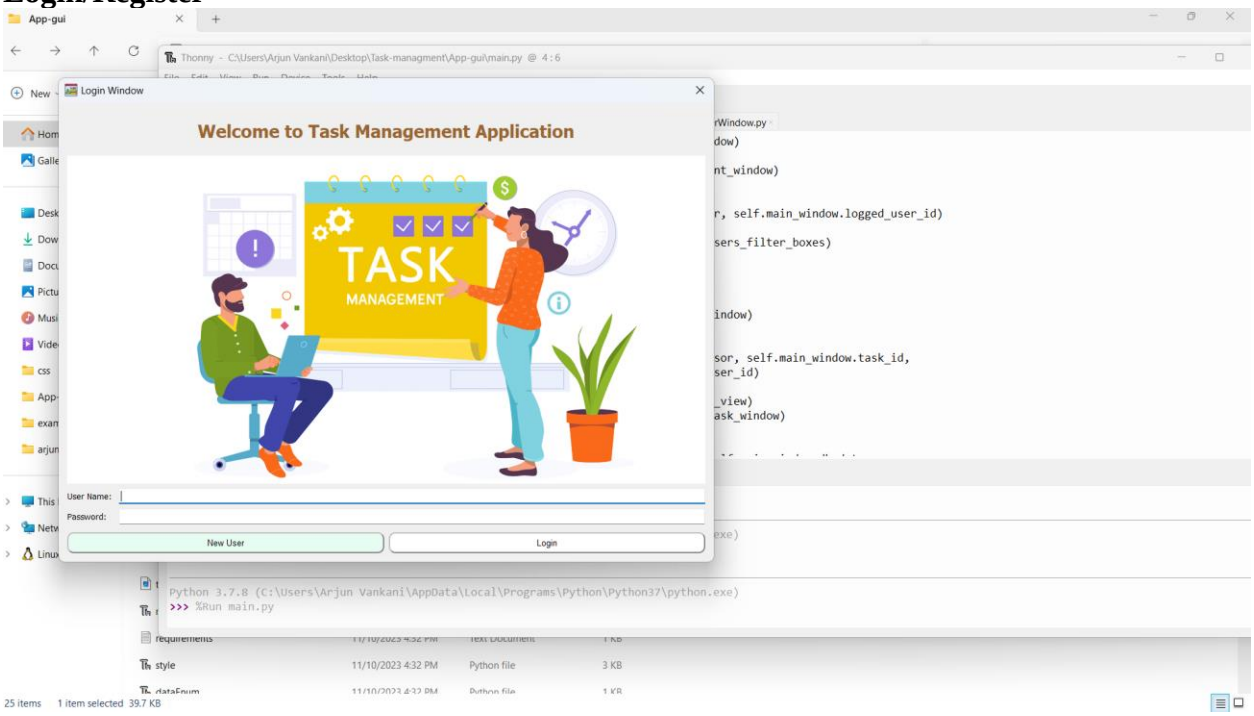

Tasks are categorized based on their status – 'To Do,' 'In Progress,' and 'Closed.' This categorization aids users in visually tracking the progression of tasks. Additionally, the Dashboard provides a comments section for each task, allowing users to communicate and collaborate effectively. Task statuses can be updated, providing real-time feedback on the progress of each task.

To enhance user experience, the application incorporates filtering options. Users can filter tasks based on their status, making it convenient to focus on tasks at different stages of completion. Furthermore, filtering by username, task management for individuals or teams. The search functionality gives quick access to task, user can search very quickly.
We can also set Profile Picture like you can see in screen shot below on screen shot.

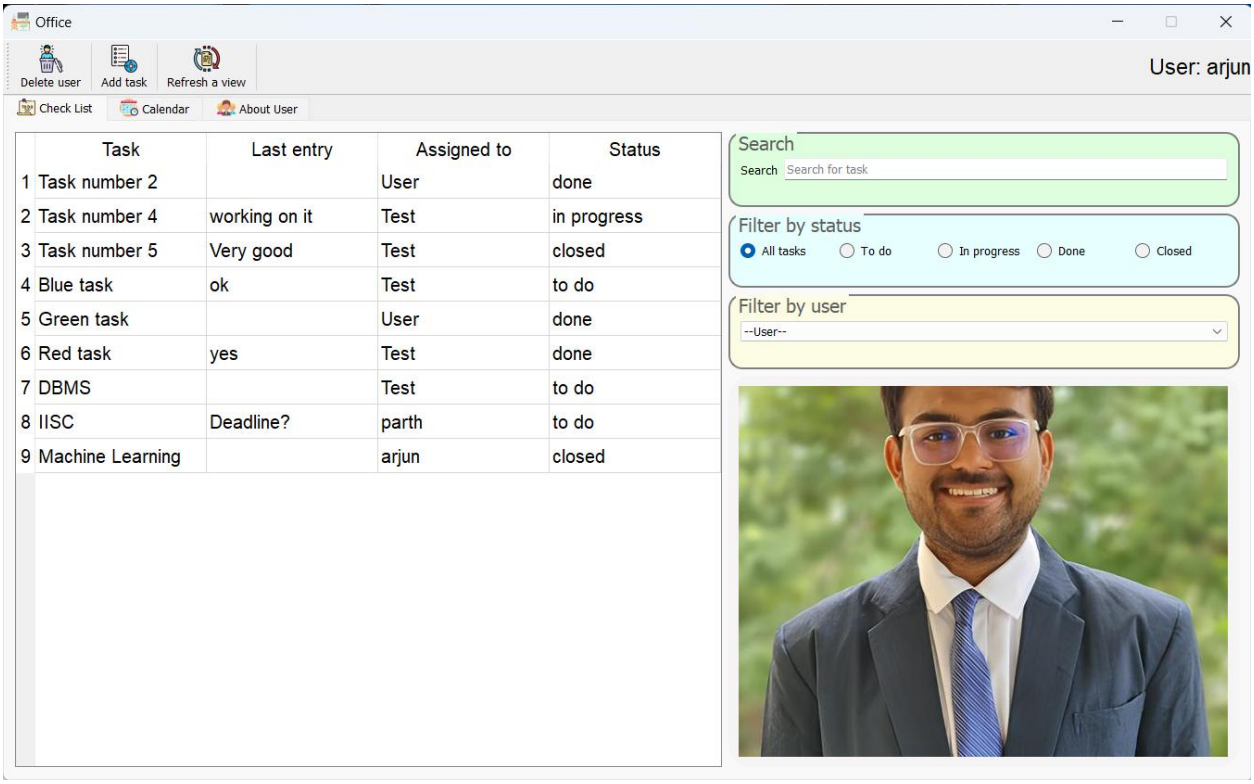

This project is not made for any agency, will made for collage project where we have Programming subject, so created for it, as learning from many sources and exploring more about PYQT, Tinker and many more.
